

## My cfg: FreeBSD

### Disable .core files

```
sysrc dumpdev="NO"
```

That is for the dump that the OS creates when it crashes, not for the core files that individual programs create. For stopping those, the *limit* (csh) or *ulimit* (sh) technique should work. One of the things that makes that technique a bit difficult is that these commands need to be executed in the environment of the program itself.

#### [.bash\\_profile](#)

```
ulimit -c 0
```

#### [/etc/csh.login](#)

```
limit coredumpsize 0
```

But overall you can:

#### [/etc/sysctl.conf](#)

```
kern.coredump=0
```

or reroute them by:

#### [/etc/sysctl.conf](#)

```
kern.corefile=/dev/null
```
